

A3 - Nth Prime Number

You are to complete the given function:

```
def nthPrime(n):  
    """ nthPrime determines the nth prime number.  
  
    -- param  
    n : int  
  
    -- return  
    integer  
    """
```

nthPrime finds the prime number at the n location of the prime number series.

You may assume that:

- The first (1st : n = 1) prime is 2
- The second (2nd: n = 2) prime is 3

Your nthPrime function will return the prime number at that location.
